

Find an AED in Singapore: Use myResponder Before You Need It

Description

Use SCDF's myResponder app to locate nearby public AEDs and call 995 with geolocation.

Check the AED's operating hours, building, floor and exact location description in advance because the nearest map point may not be accessible at every hour.

Check more than distance

The dataset includes operating hours and location descriptions because a close AED behind a closed office or security door may not be usable. Record a primary and backup device for every regular venue. ([SCDF myResponder app guide](#))

Building names are not enough in malls, stations or campuses. Floor level, unit, fire command centre or reception details save time. Walk the retrieval route during normal operations without interfering with the equipment.

Situation

Planning for a venue
Person is unresponsive and not breathing normally
AED is behind a locked door
You are alone

What changes

Check the nearest two AEDs and access hours
Call 995, start CPR and send someone for the AED
Use the next verified location while CPR continues
Follow 995 instructions and use myResponder location support

Call 995 first

myResponder's Call 995 feature can send geolocation to the Operations Centre. Dispatch and CPR should start while another person retrieves the AED. Do not delay the emergency call while searching several map points. ([SCDF Public Access AED dataset](#))

One person calls and relays instructions, one begins CPR, one retrieves the AED and one meets responders when enough people are present. At an event, put the role card beside the first-aid kit and brief staff.

Example: A venue's nearest AED is 80 metres away but accessible only during office hours. A second device 140 metres away is available 24 hours. The plan should use the first by day and the second after hours, with both routes tested.

Follow the device prompts

An AED analyses the rhythm and only advises a shock when appropriate. Keep CPR pauses as short as the voice prompts allow and make sure nobody touches the patient during analysis or shock. The 995 dispatcher and trained responders remain the controlling guidance.

The public dataset shown on data.gov.sg has a last-updated date and records can change. A building renovation, access policy or moved device can invalidate an old map. Recheck quarterly and before every large event.
