

Singapore Climate Vouchers 2026: How to Spend S$400 Well

Description

default watermark

The useful answer: eligible Singapore households can claim a total of S$400 in Climate Vouchers and use them on 12 types of energy- and water-efficient appliances and fittings. The current vouchers expire on 31 December 2027. The best use is usually a product that genuinely needs replacement, passes the programmeâ??s exact efficiency threshold and still makes sense after delivery, installation, running cost and warranty are counted.

This guide was checked on 15 July 2026 against the Climate Friendly Households Programme, NEA and PUB pages. Product lists, participating outlets and terms can change. Verify the exact product and retailer on the official site before paying.

Climate Vouchers are separate from CDC Vouchers. Their eligibility, approved products, retailer list and redemption rules come from the Climate Friendly Households Programme; a CDC Voucher balance does not establish Climate Voucher eligibility.

Who can claim the S$400 Climate Vouchers?

The official Climate Vouchers programme page separates eligibility by address. A Singapore Citizen or Permanent Resident registered and residing at an HDB flat can qualify. For a private residential property, the registered resident must be a Singapore Citizen. One eligible household at one registered address receives one S$300 set and one S$100 set.

If the HDB household already claimed the S$300 set made available from 2024, it can claim only the additional S$100 set. If it did not claim that earlier set, it can claim both. An eligible private-property household can claim the S$300 and S$100 sets. Multiple families or tenants at the same registered address share one set of each value; the programme is not S$400 per family within the address.

Household situation	Current programme position	Check before claiming
Eligible HDB household that already claimed S$300	May claim the additional S$100	Use the same registered address and check that nobody else has claimed for it.

Household situation	Current programme position	Check before claiming
Eligible HDB household that did not claim S$300	May claim the S$300 and S$100 sets	Only one resident needs to claim for the household.
Eligible Singapore Citizen household at private property	May claim the S$300 and S$100 sets	Permanent-resident-only private households are not included in the published test.
Several families or tenants at one address	One shared S$300 set and one shared S$100 set	Agree who will claim and how the household will use them.

Only one household member needs to claim through Singpass. The official claim-and-spend guide says the resulting SMS comes from â??gov.sgâ?• and its unique voucher link begins with **https://voucher.redeem.gov.sg/**. NEA, PUB and RedeemSG do not ask for personal or bank details by SMS to release the vouchers.

What the vouchers can buy from 15 April 2026

default watermark

The 2026 programme covers 12 product types. Eligibility is not based on a shopâ??s description such as â??ecoâ?•, â??greenâ?• or â??energy-savingâ?•; the model or fitting must meet the stated programme threshold. The live eligible-products page lists:

- five-tick air-conditioners;
- three-tick basin taps and mixers;
- five-tick clothes dryers, newly included from 15 April 2026;
- direct-current fans using a DC motor, excluding models with non-LED lights;
- induction stoves, newly included from 15 April 2026;
- LED lights rated two ticks and above;
- refrigerators rated three ticks and above;
- three-tick shower fittings;
- three-tick sink or bib taps and mixers;
- five-tick water heaters;
- washing machines rated four ticks; and
- three-tick water closets.

A broad product category is not enough. A retailer may sell both eligible and ineligible models, and one outlet in a chain may participate while another arrangement differs. Check the exact model against the official list and the outlet against the current participating-retailer finder.

Use a replacement-first rule

A voucher lowers the purchase price; it does not make an unnecessary purchase economical. Start with the household problem. Is an appliance failing, unsafe, costly to repair or clearly inefficient? Is a fitting leaking? Will an induction stove fit the householdâ??s cookware, electrical capacity and cooking habits? If the existing item works reliably and suits the home, waiting can preserve both cash and material resources.

Rank possible uses in this order:

1. **Urgency:** replace a failed or unsafe essential item before a lifestyle upgrade.
2. **Frequency:** give more weight to equipment used every day than to an occasional device.
3. **Fit:** confirm dimensions, power supply, plumbing, ventilation and household habits.
4. **Whole cost:** compare final cash outlay and likely running cost, not the sticker discount.
5. **Service:** check warranty, installation responsibility, repair support and disposal.

This also avoids rushing because of a sales banner. The current programme deadline is 31 December 2027, not the end of the present promotion. For wider support dates, LBRDâ??s 2026 household support calendar covers a different search intent and should not be used to determine Climate Voucher product eligibility.

Compare the full replacement cost

Use one line for every shortlisted model:

default watermark

Net first cost = displayed product price â?? Climate Vouchers used + delivery + installation + required accessories + disposal charges not covered + financing charges.

Then add the expected energy or water cost over the period the household is likely to keep it. NEAâ??s energy-label guide explains that labels show a tick rating and an estimated annual energy cost based on standard assumptions. Use that figure to compare similar products, but do not treat it as a prediction of the householdâ??s bill: actual usage, tariff, settings and maintenance differ.

For a water product, check the PUB water-efficiency label and registration details. For any item, record model number, capacity, tick threshold, final price, annual-cost label where available, warranty years and the installerâ??s quote. A higher-capacity appliance can consume more in the home even when it has a strong efficiency rating, so compare models that meet the same practical need.

Checkout rules that prevent an expensive mistake

The official terms say the vouchers come in S$2, S$5, S$10 and S$50 denominations. If the selected voucher value exceeds the amount due, there is no refund of the excess. If it is short, the household pays the balance. Vouchers from different registered addresses cannot be combined in one transaction.

At the participating outlet, the voucher holder should be ready to show personal identification or another document that displays the residential address so the retailer can match it to the voucher. Select the amount only after the cashier confirms the exact item is eligible and the final payable total. Do not send the voucher link or QR code to an unknown seller through a messaging or social-media account.

The official Climate Vouchers FAQ says NEA and PUB will not retrospectively reimburse a purchase when the voucher was not used at the point of purchase. The same FAQ says exchanges depend on the participating retailerâ??s policy and must remain within eligible products. Ask for the return, exchange and warranty terms before redemption, especially for a product that requires installation.

A six-question decision card

1. Does this item need replacement before 31 December 2027?
2. Does the exact model meet the current programme threshold?
3. Is this exact outlet listed as participating today?
4. What is the final installed cost after vouchers, not just the advertised price?
5. What do the official energy or water label and warranty say?
6. Who will keep the receipt, voucher record and installation documents?

For households considering several sustainability changes, LBRDâ??s home sustainability guide provides broader behavioural context. It does not replace the official product list or retailer checker.

Bottom line

Claim only once for the registered address, verify the exact product and outlet, and use the voucher on a replacement the household genuinely needs. Compare installed and running costs, then redeem the precise amount at checkout. The S$400 is most valuable when it reduces the cost of a sound household decisionâ??not when it creates a purchase that would not otherwise make sense.

default watermark

Use a replacement-cost sheet before showing the QR code

The official Climate Voucher terms, last updated 17 June 2026, say the S$400 is split into S$300 and S$100 vouchers, can be used in S$2, S$5, S$10 and S$50 denominations, and expires on 31 December 2027. They also state that unused value is not refunded when a voucher exceeds the amount payable and that any shortfall must be paid by the household. The NEA energy-label guide is the separate authority for comparing registered appliances by ticks and annual energy cost.

Cost line	Example	Evidence to check
Eligible product price	S$699	Exact model on the official eligible list
Climate Vouchers applied	â??S$400	Available balance and retailer acceptance
Delivery and installation	+S$80	Written retailer quote
Disposal or site work	+S$40	Scope and exclusions
Household cash outlay	S$419	S$699 â?? S$400 + S$80 + S$40

This is an LBRD worked example, not a market price or savings promise. It shows why â??S$400 offâ?• is not the same as a S$299 replacement. Compare the all-in cash outlay, capacity, energy-label estimate, warranty and installation constraints before redemption; never forward the voucher link or let another person use Singpass on the householdâ??s behalf.

Official programme and NEA appliance guidance rechecked 21 July 2026. Retail prices remain variable.
