

Southwest Monsoon Begins: NEA Expects More Warm Nights In Early June

Description

NEA says winds over Singapore are forecast to strengthen and blow from the southeast or southwest in early June 2026 as the Southwest Monsoon sets in over the region. The agency notes that this monsoon phase typically extends into September and is generally drier than other parts of the year.

For households, the immediate point is warmer nights. NEA's advisory points to more warm nights in the first fortnight of June, with localised short-duration thundery showers expected over parts of the island in the late morning and afternoon on some days.

What It Means Day To Day

Warm nights can be more disruptive than hot afternoons because they affect sleep, fans, air-conditioning use and how comfortable homes feel after sunset. Families with young children, older adults or anyone sensitive to heat should watch bedroom ventilation, hydration and late-evening activity plans.

Short-duration thundery showers also mean the day can still turn quickly even during a generally drier monsoon phase. A small umbrella or rain jacket remains useful for school runs, office commutes and evening plans around exposed areas.

- Advisory date: 2 June 2026.
- Weather pattern: Southwest Monsoon setting in over the region.
- Seasonal note: usually extends into September.
- Expected first-half June pattern: more warm nights and some localised thundery showers.

Practical Planning

Use the myENV app or NEA updates before outdoor exercise, school-holiday activities or site work. If you are planning evening events, do not assume a clear afternoon means a comfortable night.

Read NEA's [Southwest Monsoon advisory](#) for the latest agency wording. For more local updates, visit our [News](#) page.

- Hydrate before late-afternoon errands or sports.
- Keep rooms ventilated before bedtime.
- Plan outdoor activities with both heat and short showers in mind.
