

The World Ageing Festival (8 – 9 April 2025) at Marina Bay Sands

Description

This is the reason why I think we have gotten ageing wrong. I went to the World Ageing Festival thinking that I could get insights as to how I could maintain my health and perhaps, possibly, recover some lost years. However, the World Ageing Festival seemed to be more about how we are supposed to accept the eventual inevitability of us ageing and becoming weaker.

To be frank, it started out well. When my colleague and I entered the exhibition hall, the first exhibitor we stumbled upon was TechnoGym. If you are not already familiar with TechnoGym, they deal with high-end gym equipment. The focus is on fitness, health and wellness. That TechnoGym checkup seemed enticing so I stepped forward.

Oh and coincidentally I met my secondary schoolmate who is now with TechnoGym. Not bad, had a mini catch up session...

The TechnoGym checkup consisted of a series of tests. You had to download the TechnoGym app and create an account. From there they would give you a score out of 100 to indicate how you fared against people across your age group and gender.

I do not know who this was. But from the readings, this person scored 67/100. The body composition analysis required you to step on the scale and hold two handles. I believe some would be familiar with such tests that are usually available at some commercial gyms. This system by TechnoGym does have that similar function but it also tests other aspects of your body like flexibility, strength and mind to give you a more holistic overview of your overall wellness.

Someone was going through the body composition test. You need to remove your socks so that your bare skin makes contact with the metal portions of the scale and the handles. An electrical current passes through our body to get an estimate of the amount of body fat and muscle mass we are carrying.

This is one of the ways the system tests for flexibility. There is a camera at the front of the system. This is something like the Microsoft Kinect system. It can sense your body in space.

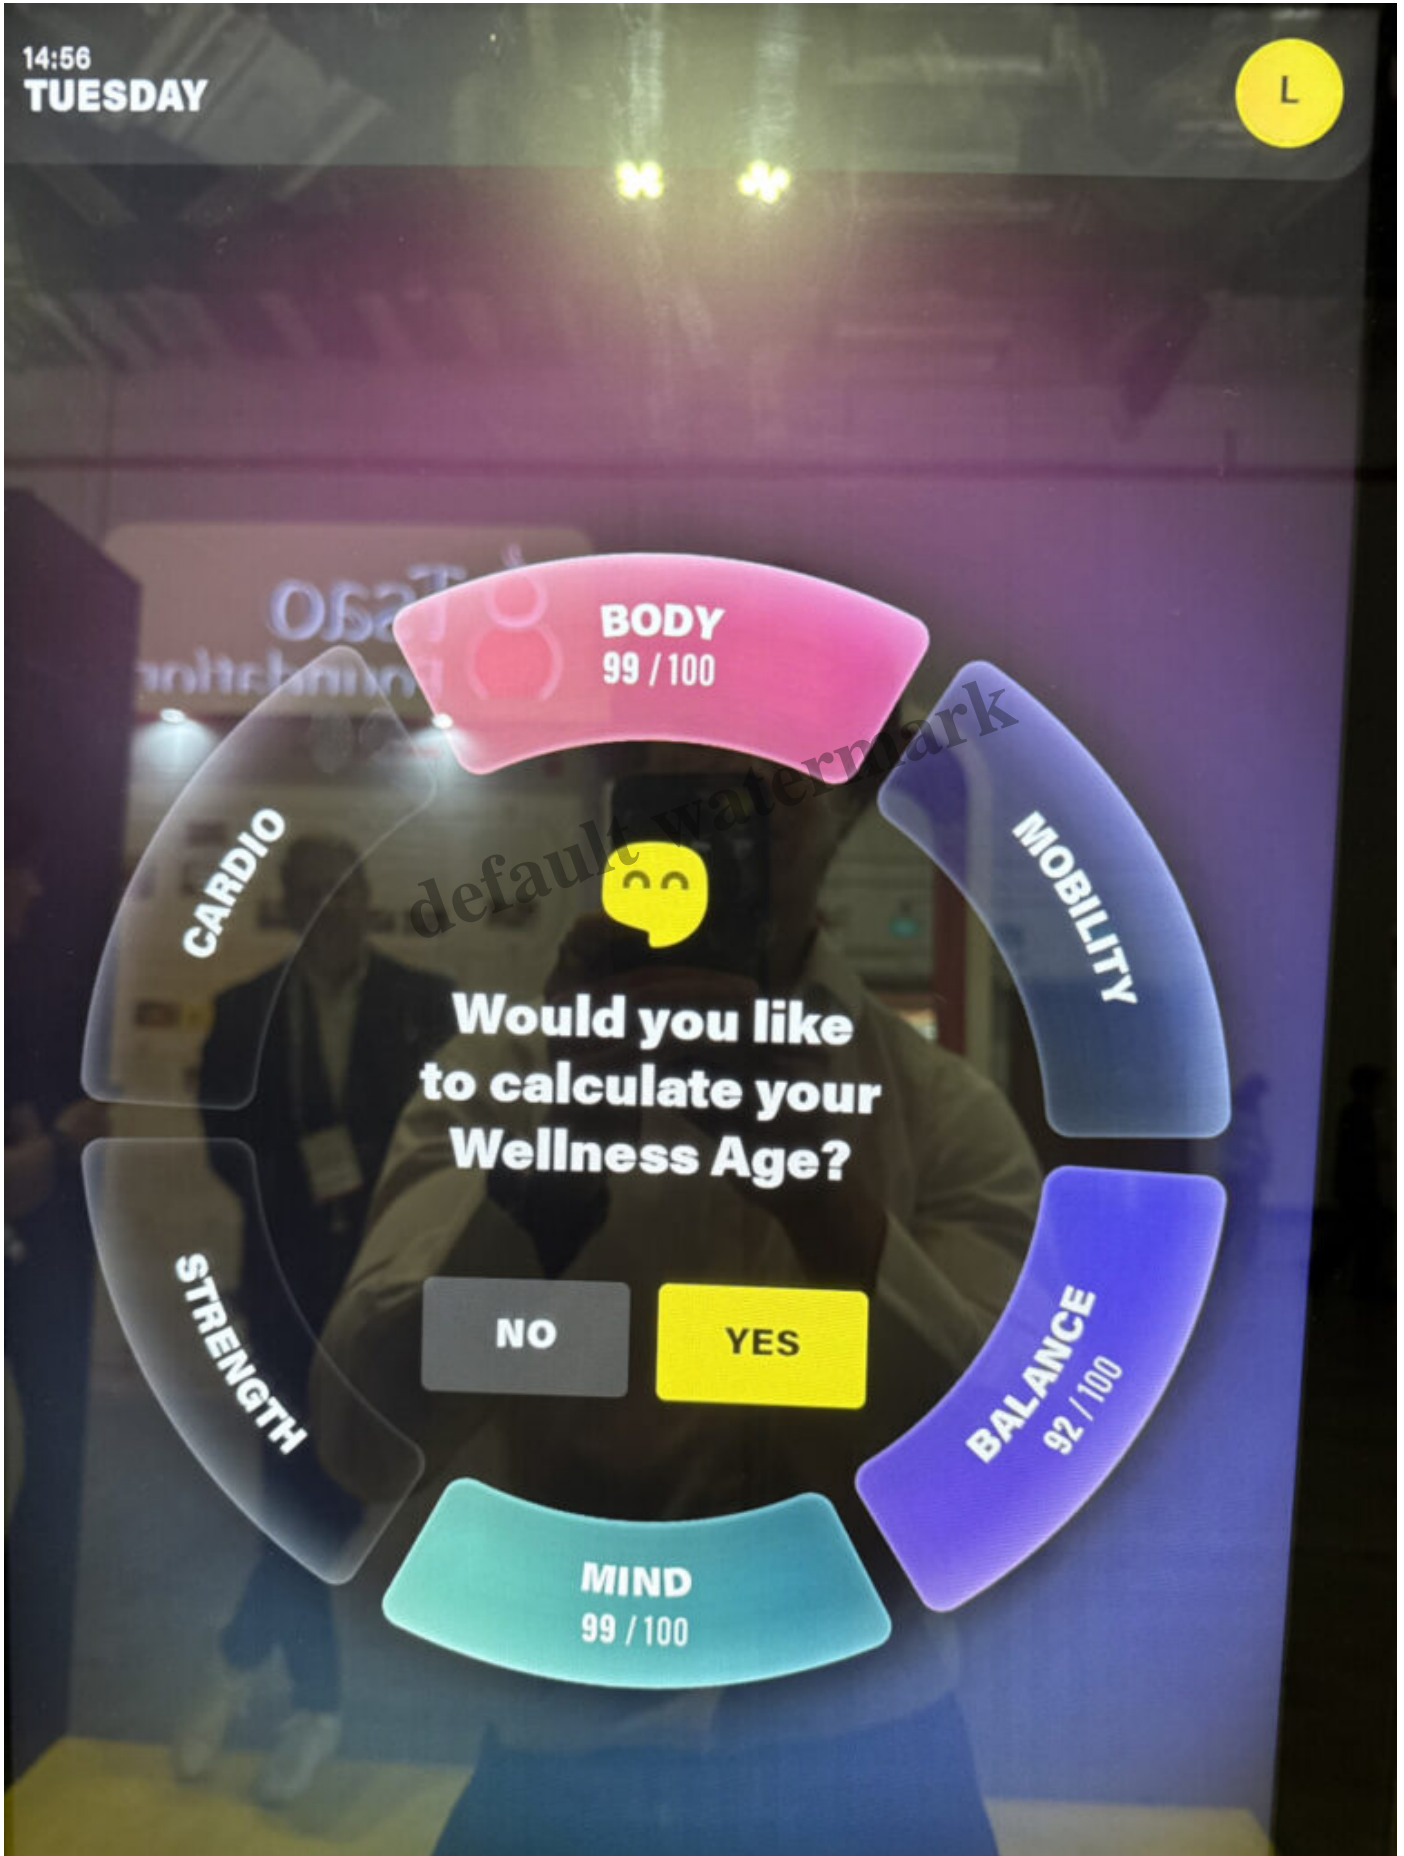

Ah... my mind is doing well... The mind test involved you having to recall the location of certain items on the screen which would be flashed to you for a split second.

default watermark

I took the balance and body composition test as well. I did not complete the mobility test. I only took one mobility test which involved me stretching my hands over my head and the system would analyse my range of motion through the camera. I think I did well for that as well.

default watermark

After looking at these numbers, I can safely say that eating healthy works.

HIGHLIGHTS

Normal BMI is associated with a reduced risk of cardiovascular disease, and a balanced body composition contributes to better weight management and optimal metabolic health.

One thing I would like to know is whether the figures should be high or low. For example, my extracellular water is low. I need to know whether this is good or not and how to change this. Same for phase angle. I do not know what is that and how I can improve it. Perhaps something for TechnoGym to think about for future updates to their system?

Of course my colleague Willie wanted to try this out as well.

Smart Walking Stick Passionately Designed in Singapore

Parkinson's disease (PD), the second most common neurodegenerative disease, affects 7-10 million people globally, with cases rising sharply over the last three decades. Prevalence of just PD is a common symptom, reaching over 50% of PD patients. Symptoms vary by age and progress the top of limb, rigidity, and loss of independence.

The LaserStick is a lightweight carbon fibre walking aid designed to combat PD using clinically proven visual and audio-cueing techniques. It promotes safer, more independent mobility by reducing walking hesitation and preventing falls at a reasonable price.

Laser Line (Visual Cue)

A green laser line projects onto the floor, guiding users to step forward confidently. Its angle is adjustable for optimal positioning, and an integrated LED footlight enhances safety in low light conditions.

Metronome Beat (Audio Cue)

Amplicon, multi-tone beat helps users maintain a steady walking pace. Adjustable speeds allow customization to suit individual walking rhythms.

Auto-Fall Alarm

If a fall occurs, an automatic alarm alerts caregivers for immediate assistance. This feature mitigates the risk of shock and injury during emergencies.

Interchangeable Base Design

The adjustable base transforms from a quad cane for stability to a single cane for mobility. This versatility allows users to adapt the stick to their specific needs.

- Laser Line
- Metronome Beat
- Auto-Fall Alarm
- LED Touch Light
- MP3 Player, FM Radio

See what I mean by most of the exhibitors were not about how we can maintain health and wellness but rather about how to deal with the ailments that come with ageing?

I must say that AI is playing a large role in exhibitions. Not just in this one.

default watermark

This exhibitor creates fitness and wellness solutions for sports performance, active aging and rehabilitation.

Overall, the place was not overly crowded. Considering that this is a two-day event, I think this is a very niche event catered more to those that run hospitals, nursing homes and organisations that deal with the elderly.

There were some talks going on. Once again, the topics were very niche.

Possible? This claims to improve cognitive functions. Perhaps delaying the onset of dementia?

default watermark

Here are some more photos of the event.

default watermark

default watermark

Perhaps in future reiterations of this event, we should think of how we can encourage those who are ageing to think about how to maintain and preserve what they have. Possible even improve? This event seemed to remind me that I will inevitably become old and these are the tools to help me get by...

Well, if you are still interested in the festival, details can be found here:
